AWS Task-1 Practice Guide

This guide is written for **absolute beginners**. Follow it step by step to practice creating a **Windows EC2 instance on AWS** and connecting to it from **Ubuntu using Remmina (RDP)**.

---

1. Objective of the Task

You will: - Create a **Windows Virtual Machine (EC2)** in AWS - Allow **RDP access (port 3389)** - Connect to the instance from **Ubuntu using Remmina** - Open **Command Prompt (CMD)** in Windows - Display **system information** - Clean up AWS resources safely

---

2. Prerequisites

Before starting, ensure: - You have an **AWS account** - You have **Ubuntu OS** installed - You have **internet access** - You can use the terminal

---

3. Login to AWS Console

1. Go to https://console.aws.amazon.com/
2. Login with your AWS credentials
3. Select a **Region** (example: Europe – Stockholm, Asia Pacific – Mumbai)

---

4. Open EC2 Dashboard

1. In the AWS search bar, type **EC2**
2. Click **EC2**
3. Click **Launch instance**

---

5. Launch a Windows EC2 Instance

5.1 Name the Instance

- Name: `windows-ec2-task1`

5.2 Choose Amazon Machine Image (AMI)

- Select **Microsoft Windows**
- Choose **Windows Server 2019 Base** (or latest available)

5.3 Choose Instance Type

- Select: `t3.micro` (or `t2.micro` if available)

5.4 Create a Key Pair

1. Click **Create new key pair**
2. Name: `windows-keypair`
3. Key pair type: **RSA**
4. File format: **.pem**
5. Download and store safely

   This key is used to decrypt the Windows Administrator password.

5.5 Configure Network Settings

- Auto-assign Public IP: **Enable**
- Create a new security group
- Allow **RDP traffic** from:
- Source: `Anywhere (0.0.0.0/0)`

  This automatically allows TCP port **3389**.

5.6 Storage

- Keep default (30 GB)

5.7 Launch Instance

- Click **Launch instance**
- Wait until **Instance state = Running**
- Status checks should show **2/2 or 3/3 passed**

---

6. Get Windows Administrator Password

1. Select the running instance
2. Click **Connect**
3. Choose **RDP Client**
4. Click **Get password**
5. Upload your `.pem` key file
6. Click **Decrypt password**

Note down: - Username: `Administrator` - Password: (decrypted value)

---

7. Install Remmina on Ubuntu

Open terminal and run:

```
sudo apt update
sudo apt install remmina remmina-plugin-rdp -y
```

---

8. Connect to Windows EC2 using Remmina

8.1 Open Remmina

- Search for **Remmina** in applications
- Click **+** to create a new connection

8.2 Configure RDP Connection

Fill the fields exactly:

- Protocol: **RDP – Remote Desktop Protocol**
- Name: `AWS Windows EC2`
- Server: `<Public IPv4 address of EC2>`
- Username: `Administrator`
- Password: `<Decrypted password>`
- Domain: *(leave empty)*

In **Advanced settings**: - Security protocol: **RDP**

Click **Save** → Double-click the connection

---

9. Windows First Login

- Wait while Windows prepares the desktop
- You will see a Windows Server desktop

---

10. Open CMD and Display System Info

Inside the Windows VM:

1. Click **Start**
2. Type `cmd`
3. Open **Command Prompt**
4. Run:

```
systeminfo
```

This displays: - OS Name & Version - Hostname - Memory - System type

---

11. Screenshots to Practice

Take screenshots of: - EC2 instance running in AWS console - Windows desktop via RDP - CMD window showing `systeminfo`

---

12. Stop or Delete the Instance

Stop (Temporary)

- EC2 → Instances → Instance state → Stop

Terminate (Permanent – Recommended after practice)

- EC2 → Instances → Instance state → Terminate

---

13. Optional Cleanup

- Delete key pair if not reused
- Delete unused security groups
- Check and delete unused volumes

---

14. What You Learned

By completing this guide, you practiced: - AWS EC2 basics - Windows VM provisioning - Security groups & RDP - Remote access from Linux to Windows - Cloud resource cleanup

---

15. Practice Tip

Repeat this entire process **2–3 times** to build confidence. The more you repeat, the more natural AWS will feel.
